Fetal Development

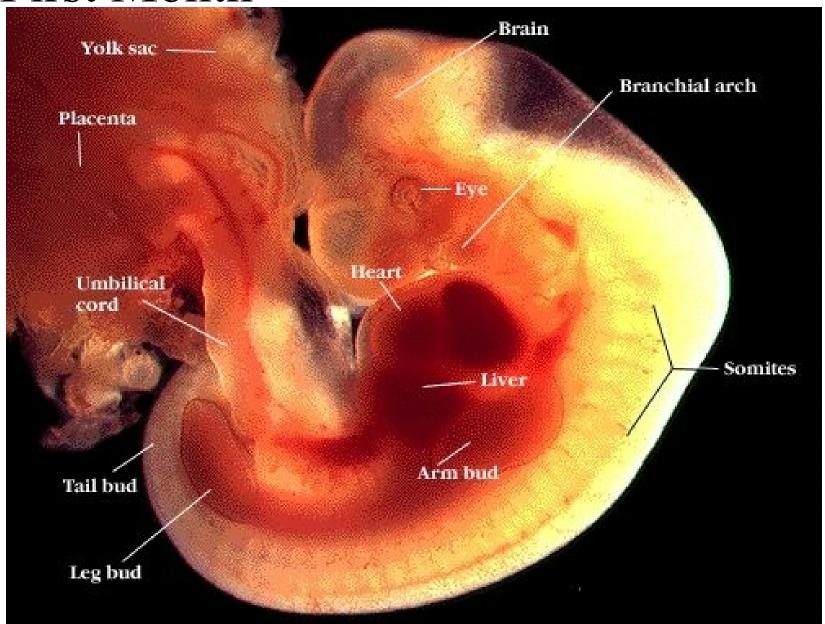

Month by Month

First Month

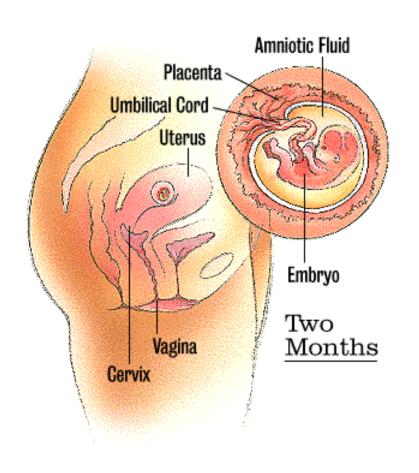

By the end of the first month, the embryo is about 1/10 of an inch long. The heart, which is no larger than a poppy seed, has begun beating.

First Month

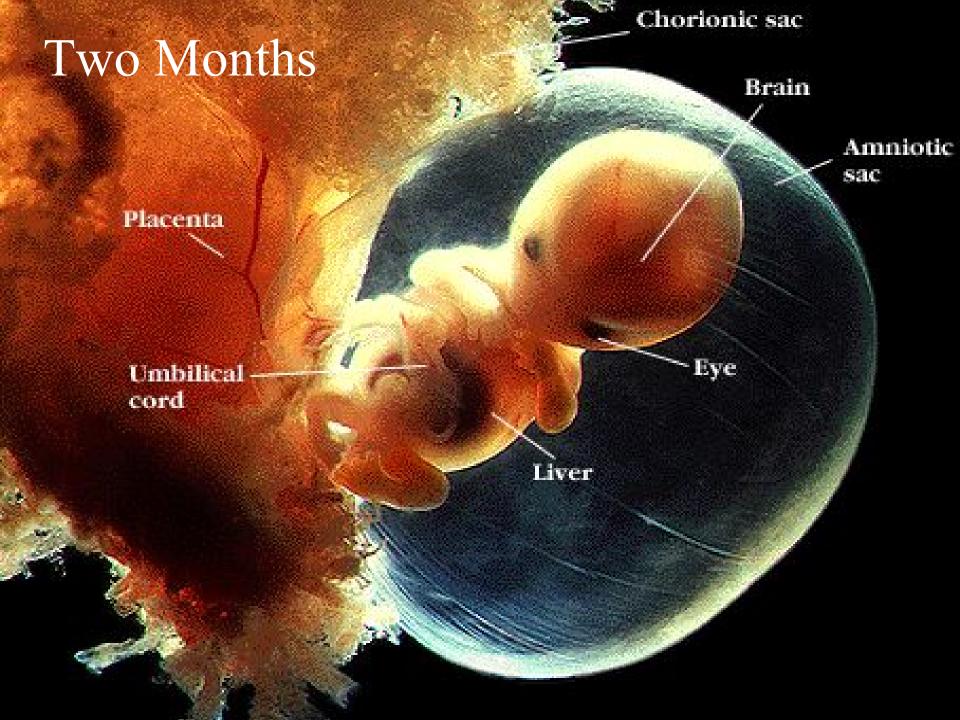

Two Months

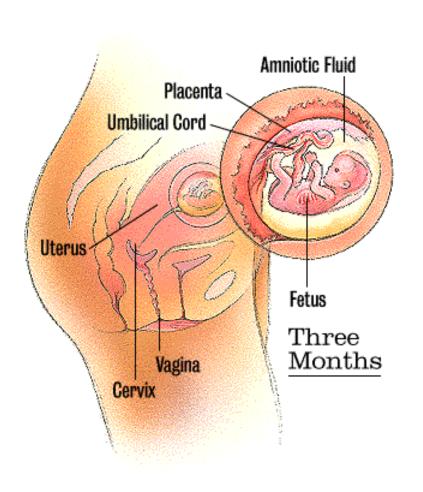

The embryo is about
 1 inch long and has
 distinct, slightly
 webbed fingers.

 Veins are clearly
 visible. The heart
 has divided into right
 and left chambers.

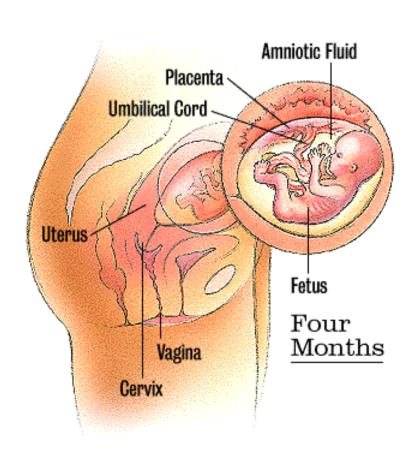

Three Months

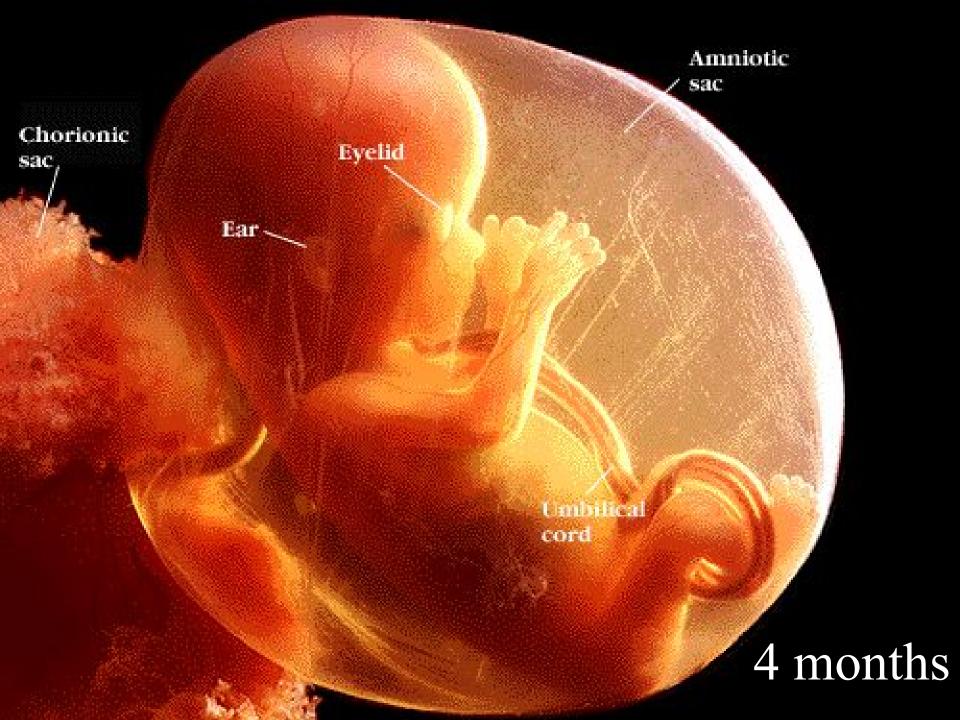

By now the fetus is 2
 1/2 to 3 inches long
 and is fully formed. He
 has begun swallowing
 and kicking. All organs
 and muscles have
 formed and are
 beginning to function.

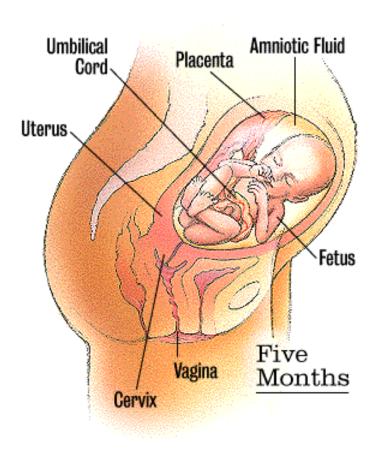

Four Months

 Your baby is covered with a layer of thick, downy hair called lanugo. His heartbeat can be heard clearly. This is when you may feel your baby's first kick.

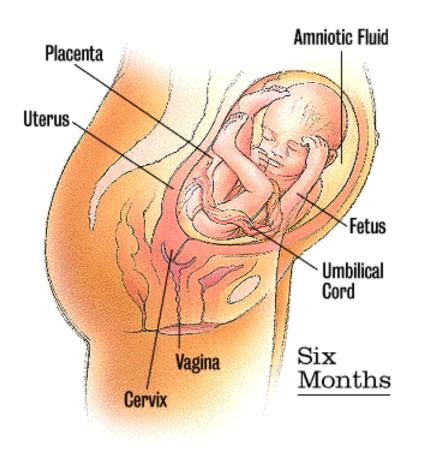

Five Months

 A protective coating called vernix caseosa begins to form on baby's skin. By the end of this month, your baby will be nearly 8 inches long and weigh almost a pound.

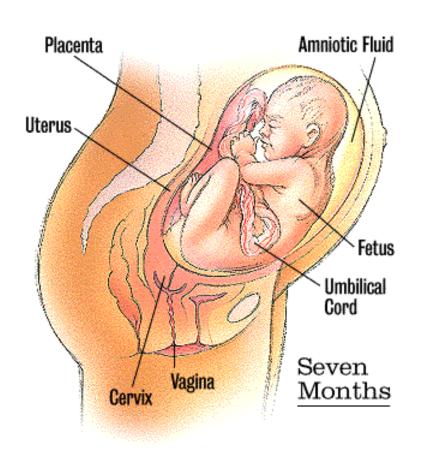

Six Months

 Eyebrows and eyelids are visible. Your baby's lungs are filled with amniotic fluid, and he has started breathing motions. If you talk or sing, he can hear you.

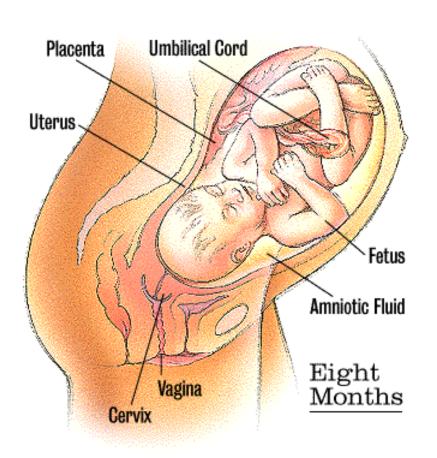

Seven Months

 By the end of the seventh month, your baby weighs about 3 1/2 pounds and is about 12 inches long. His body is well-formed. Fingernails cover his fingertips

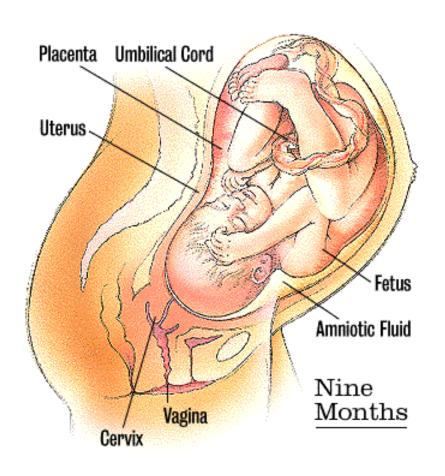

Eight Months

 Your baby is gaining about half a pound per week, and layers of fat are piling on. He has probably turned head-down in preparation for birth. He weighs between 4 and 6 pounds.

Nine Months

Your baby is a hefty
 6 to 9 pounds and measures between
 19 and 22 inches.
 As he becomes more crowded, you may feel him move around less.
